

Questão #14

PROGRESSO:

14/60

A data analysis company created an application to provide information to its customers. The application is hosted on EC2 instances in an Auto Scaling Group. You have added an Application Load Balancer to optimize this solution. The VPC hosting this architecture is running both IPv4 and IPv6. To complete the configuration, you must point the company domain to the Application Load Balancer. Using Route 53, which record type at the zone will you use to point the DNS name of the Application Load Balancer?

Selecione 2 alternativas

A A type record set.

B MX type record set.

C CNAME record set.

D AAAA type record set.
