Hubs and collision domains

Considering the topology below where we have a hub connected to four computers, how many collision domains exist?

Selecione uma alternativa

- A** There's no way to quantify since multiple collisions can occur
- B** We have a total of four collision domains, one per port
- C** We have a total of two collision domains, one collision domain would group two computers and the second collision domain would group the two other computers
- D** We have a total of one collision domain
