

Dynamic learning

You're analyzing the mac addresses learned by a Switch and you see that the column **Type** is written Dynamic. What does it mean?

Selecione uma alternativa

- A** It means that the network admin needed to configure this MAC address manually on the Switch
- B** It's just a log message to inform that an address was learned, there's no other way a Switch can learn a MAC address
- C** It means that the network admin needed to type the command **dynamic [MAC address of the device]**
- D** It means that the network admin needed to start the communication between devices so the Switch could learn the MAC addresses in a dynamic way
